
Part I - Questions

Slides: http://10kstudents.eu/m/files/material/pptx/syssec_10K_Basic_B0.pptx

1.1 Suppose the code in the example in Part I would be as follows:

```
getURL ()
{
    char anotherBuf[50];
    char buf[10];
    read(keyboard,buf,64);
    get_webpage (buf);
}
IE ()
{
    getURL ();
}
```

Would the attack still work in the same way?

1.2 Could you still exploit the system to make it jump to an address controlled by the attacker?
